

## How Will We Be Evaluated?

reason (statistical), for how we analyzed the data. why we only chose a subset?

### ❖ Dataset Analysis

- Were we able to properly assess and clean the dataset?   
 - book every major claim with a visual
- Is our conclusion meaningful, accurate, and credible?   
 - split dataset into 80/20 for training & testing
- Are we telling a story that connects the challenge to our final marketing decision?   
 - Best way to do this is design our presentation as a timeline, and move data from start to finish. 'Reviews' as a metaphor, and how it changes from start to end

### ❖ AI / ML Solution

- Is the AI approach we chose realistic, scalable, and does it well suit our problem?   
 - actually implement
- Can we explain our AI / ML solution clearly and visually without complex vocab?   
 - explain how much capacity SQL has?
- Have we addressed responsible AI, and does it adhere to user privacy and fairness?   
 - add a method to withhold user-data, and only use their responses.

### ❖ Business Insights & Recommendations

- Is our recommendation practical and implementable?   
 - code it ourselves
- Does our solution align with the needs of FusionTech?   
 - show what happens when risk > threshold & which team gets notified.
- Can we clearly model and quantify the expected final business impact? Is this believable?   
 - quote back their problem, and how we address time delay.
- One believable validation would be to start with giving model 50% data. now 'live' simulating 5% at a weekly margin, and address what it suggests to fix. If it addresses the issues in 20% testing data, we essentially 'save' that much revenue.

### ❖ Dell Infrastructure Recommendation

- Why did we choose this particular Dell product for our AI workload?   
 - choose energy statistic, and have Dell's specific product matched approx our model's usage. Statistically prove why one product is more better than the other
- How does this product compare to the alternative available products?
- Are we sure that this product could help solve FusionTech's infrastructure problems?

### ❖ Presentation Quality

- Is our presentation clear, engaging, and well-organized?   
 - use diagrams and TELL A STORY!   
 - can we pre-record?
- Does every member of our team participate in the presentation?   
 - make sure everyone participates
- Is our slideshow professional and visual? Have we avoided a lot of heavy jargon?   
 - use Dell headers   
 - use a lot of diagrams & charts   
 - DON'T GO TOO TECHNICAL!

→ Keep the presentation visual, use a lot of charts, diagrams, and images. Make sure we tell a story from problem to impact. Make sure the presentation is under 10 minutes. Executives care about ROI, not technical details.

→ Rehearse a lot, make sure we emphasize ROI, and make sure we have fun, and make the presentation engaging.
